This was an individual lab, so everything in the notebook is my own work. I went through each section in order and actually ran the code instead of just reading it, so I could see what each step was really doing. Loading the wine dataset, splitting it into train/test, training the Logistic Regression and Decision Tree models, and then comparing their accuracy.

For the hands-on part where we had to pick our own features, I went with alcohol, color intensity, and proline. That model came out to about 83% accuracy, which was actually lower than the original model's 89%. That was a good reminder for me that picking features isn't as simple as just grabbing ones that sound important, it takes some trial and error.

I also went through the assessment section myself, matching each scenario to supervised, unsupervised, or reinforcement learning, and double checked my answers against the explanations given. For the reflection section, I answered each bracketed question based on what I actually noticed while running the notebook and what I took away from the lab, rather than just repeating definitions. Once everything was done, I uploaded the completed notebook to my GitHub repo.

Contribution Journal – Cyndy Ndong

I completed all the technical and written work for Lab 03 . I executed all 25 notebook cells sequentially in Google Colab, making sure every code block ran smoothly without errors and generated clear, accurate visual outputs. Along the way, I added inline comments to explain the trickier parts of the code, double-checked the data preprocessing steps, and reviewed the classification metrics to evaluate how well the model performed.

Once the notebook was finished, I exported it using File then Print then Save as PDF to ensure

all the code, tables, and plots were cleanly formatted and readable. After that, I saved all my

submission files using the exact naming conventions required for the course and wrote up both

journals. Stepping through every single phase of the notebook from start to finish made sure I

covered all the assignment requirements and double-checked everything before submitting.
